## Tips on how to protect yourself:

### Two-factor authentication

Pick any two: Something you know, something you have, something you are

## Things to look out for:

Two-factor authentication (also known as 2FA) is a type, or subset, of multi-factor authentication. It is a method of confirming users' claimed identities by using a combination of two different factors: 1) something they know, 2) something they have, or 3) something they are. A third-party authenticator (TPA) app enables two-factor authentication, usually by showing a randomly-generated and constantly refreshing code which the user can use.

News is information about current events. This may be provided through many different media...
